

# User-specific Configuration Management for Office Extensions

Florian Haftmann, it@M  
(City of Munich)

# LibreOffice and Linux in the Municipality of Munich

- ▼ Municipality of Munich runs with an Ubuntu-based Linux system on 18.000 machines with 33.000 users
- ▼ ...with leading office platform being LibreOffice 4.1
  - ▼ transition to LibreOffice 5.0 planned

# Configuration management

users, aggregated to roles (groups)

# Configuration management

# Example: Application deployment and assignment

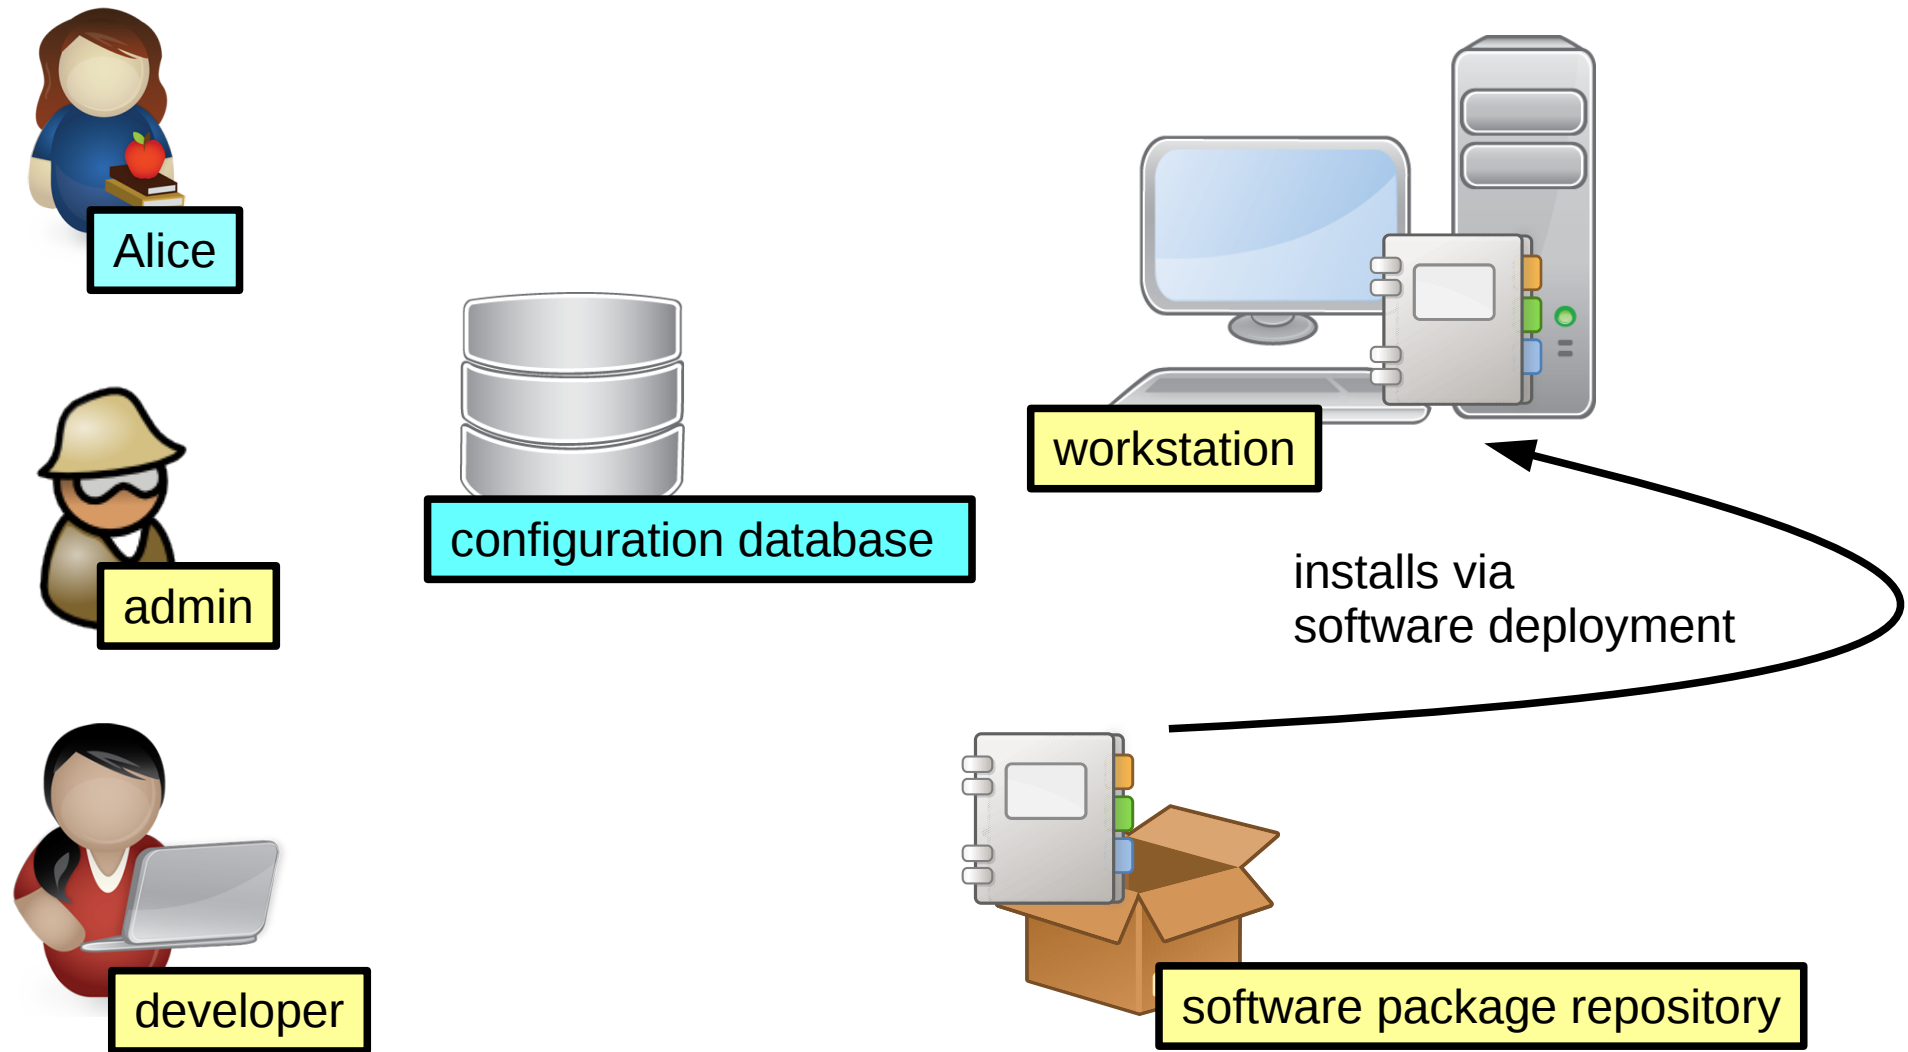

# Example: Application deployment and assignment

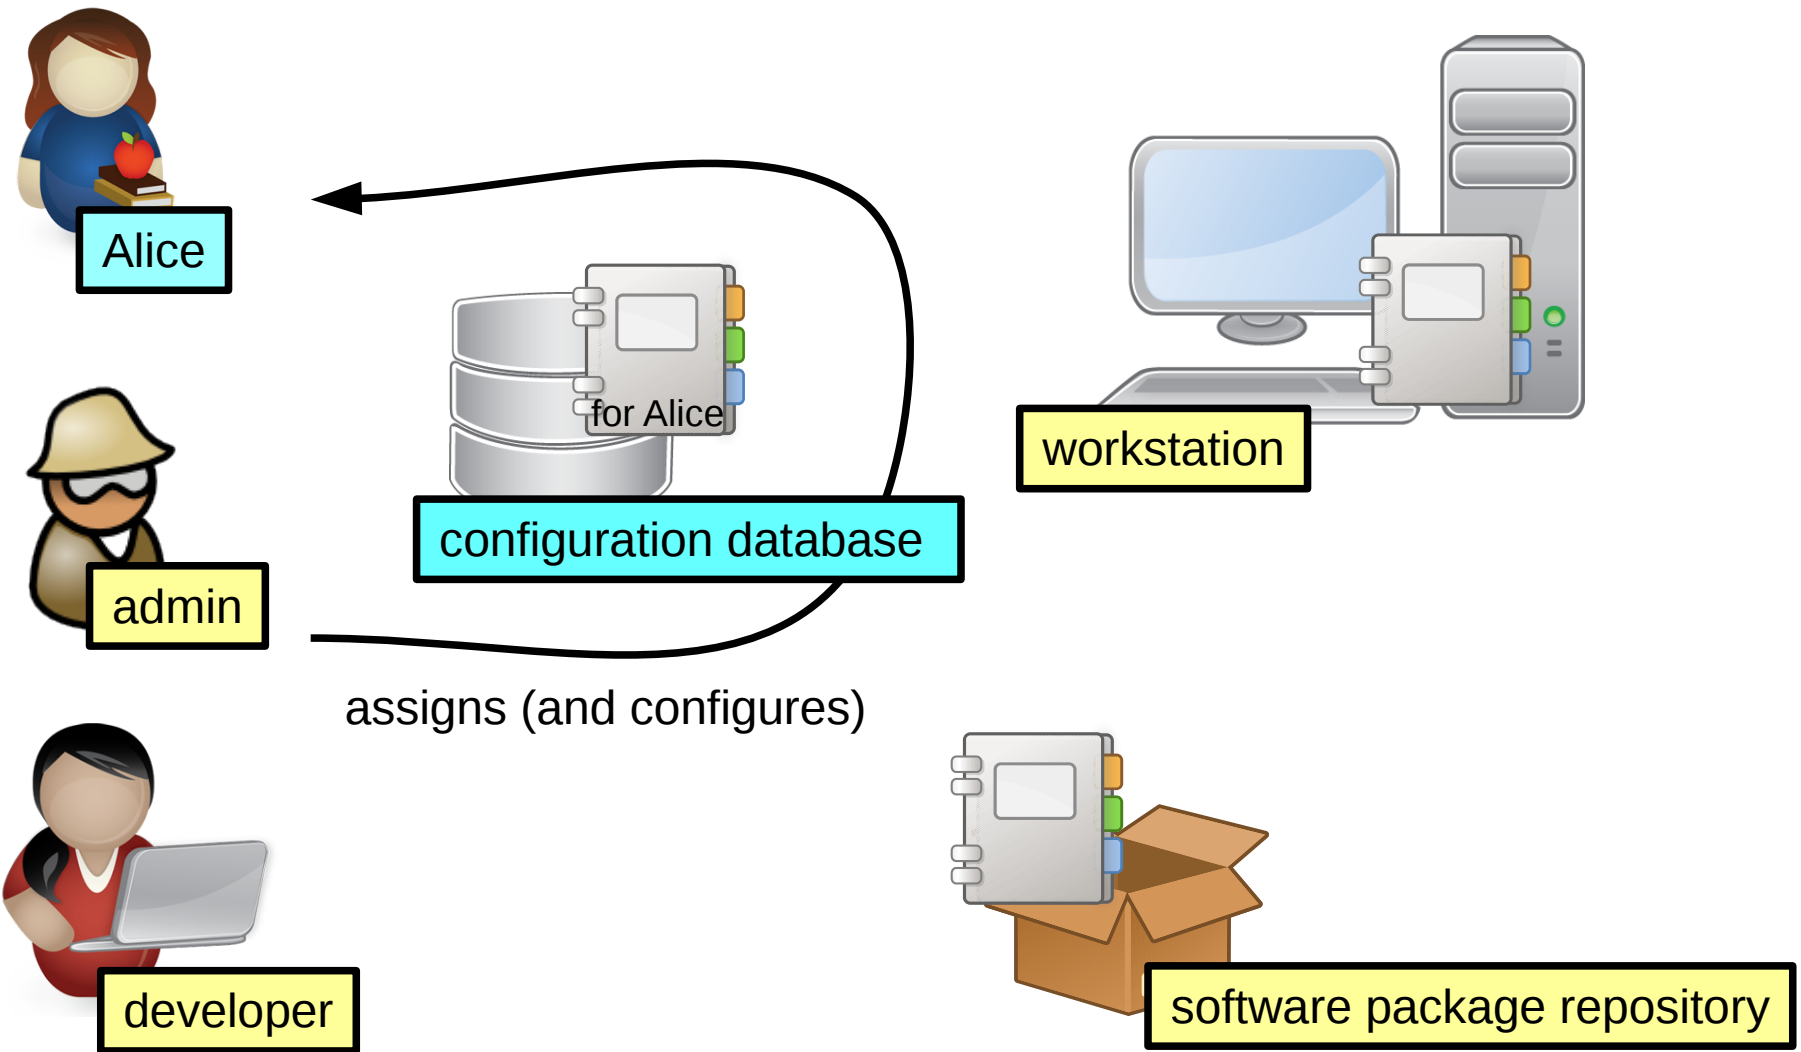

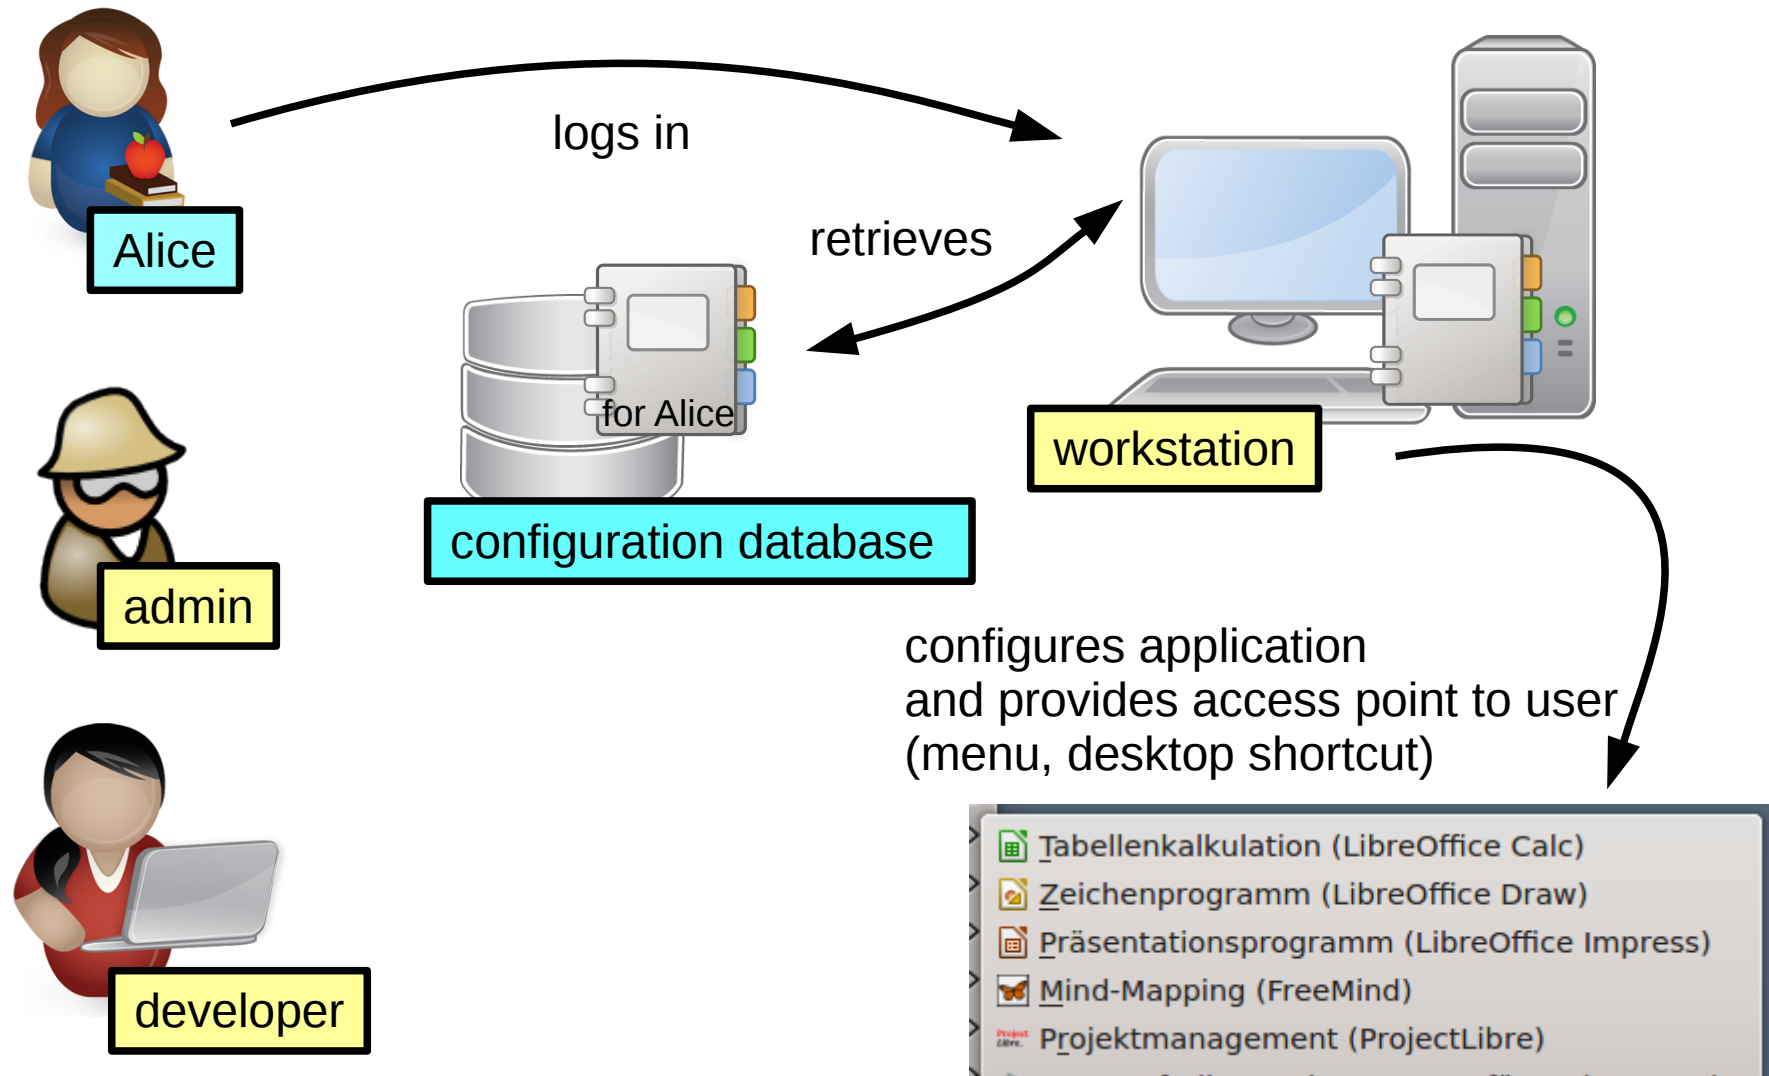

# Example: Application deployment and assignment

# Example: Application deployment and assignment

# Example: Application deployment and assignment

# Benefits

- ▼ Applications themselves can be installed generously on a huge number of workstations.
- ▼ Actual visibility is managed by configuration management.
  - ▼ User has everything she needs.
  - ▼ User is not molested by things she doesn't know about.
- ▼ Local hard disk space is cheap.
- ▼ License issues are rarely an obstacle.

# Benefits

- ▼ Variance in machines installations can be minimized:
  - ▼ Easier to regulate actual visibility of applications by configuration management than software deployment:
    - ▼ Changes in configuration management apply immediately.
    - ▼ Changes in machine installations requires dedicated installation / update runs.
  - ▼ Aim of configuration management:
    - ▼ User has everything she needs.
    - ▼ User is not molested by things she doesn't know about.

# Benefits

- ▼ Variance in machines installations can be minimized:
  - ▼ Easier to regulate actual visibility of applications by configuration management than software deployment:
    - ▼ Changes in configuration management apply immediately.
    - ▼ Changes in machine installations requires dedicated installation / update runs.
  - ▼ Applications themselves can be installed generously on a huge number of workstations:
    - ▼ Local hard disk space is cheap.

# What gets lost

- ▼ Variance in machines installations can be minimized:
  - ▼ Easier to regulate actual visibility of applications by configuration management than software deployment:
    - ▼ Changes in configuration management apply immediately.
    - ▼ Changes in machine installations requires dedicated installation / update runs.
  - ▼ Applications themselves can be installed generously on a huge number of workstations:
    - ▼ Local hard disk space is cheap.
    - ▼ License issues are rarely an obstacle.
- ▼ Explicit bookkeeping in configuration management yields a zoning map: who needs what application.

# Automated software deployment for office extensions

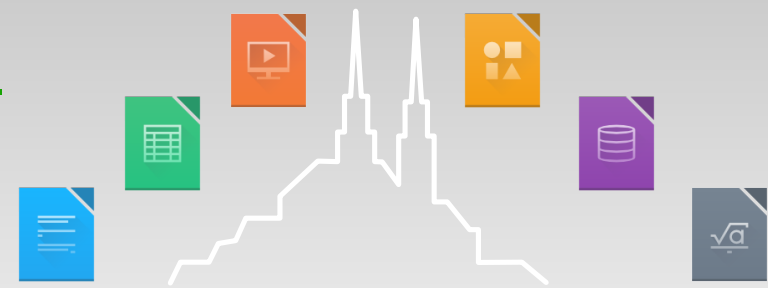

- ▼ Parametrized office extensions.
- ▼ Automated packaging and deployment of office extensions.
- ▼ Activation of office extensions based on roles.

# The simple part

- ▼ Parametrized office extensions.
- ▼ Automated packaging and deployment of office extensions.
  - No fundamental obstacles.
  - Naive: separate implementation for each extension.
  - Clever: uniform implementation for all extensions.

# Parametrized office extensions – running example

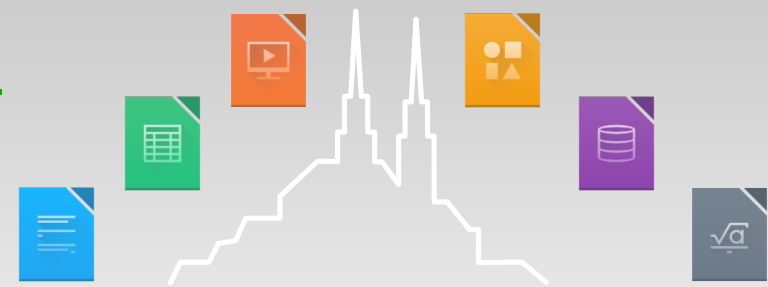

office extension: *letters to parents*

extension parameter: *path* –  
path to spreadsheet with addresses

- ▼ Extension which reads address data from a particular spreadsheet on a network drive.
- ▼ Actual network drive and spreadsheet is a priori unknown and must be configured.

# Parametrized office extensions – generic solution

office extension: *letters to parents*

extension parameter: *path* –  
path to spreadsheet with addresses

- ▼ Provide extension which allows other extensions to read (and write) settings (key-value-mappings) from (and to) a dedicated configuration file in the user's home directory.
- ▼ Use this extension for all extensions which require parameters.
- ▼ Dedicated configuration file can be filled using the *existing* configuration management, during user login.

# Packaging of office extensions

- ▼ Use standardized source layout for extensions.
- ▼ Provide *one* uniform build routine to turn such sources into a package fitting to your software deployment (e.g. Debian *deb*, Redhat *rpm*).
- ▼ Use your existing software deployment.

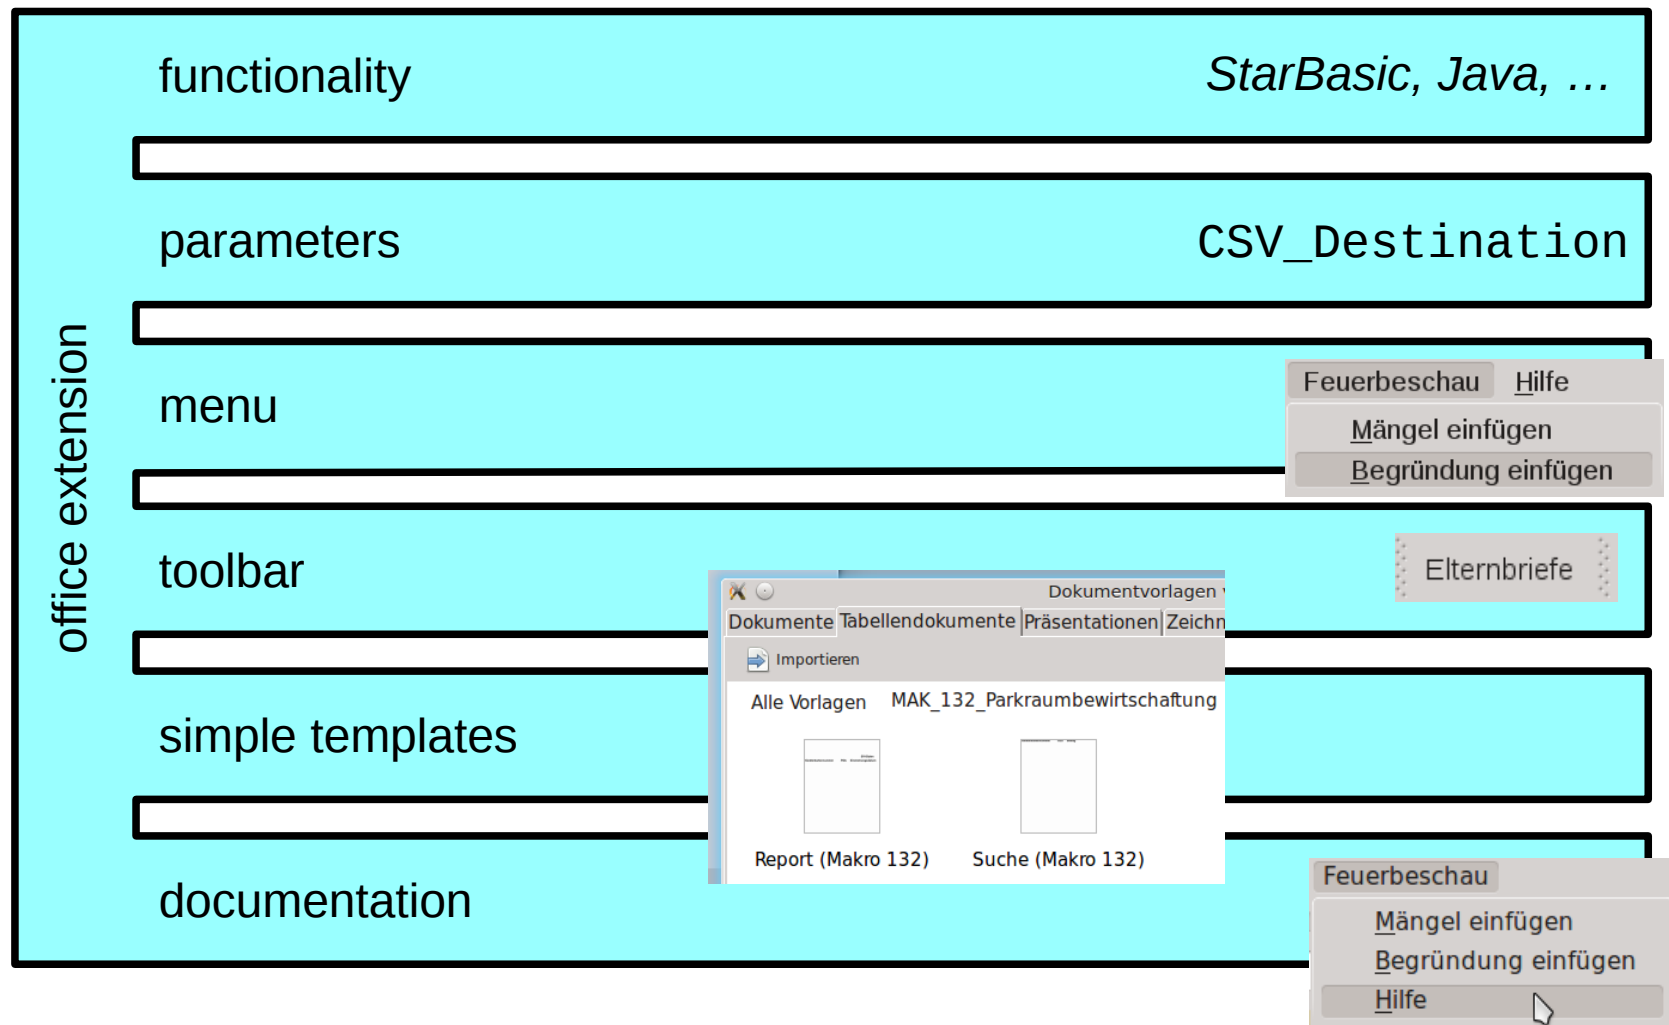

# Packaging of office extensions

- ▼ Use standardized source layout for extensions.
- ▼ Provide *one* uniform build routine to turn such sources into a package fitting to your software deployment (e.g. Debian *deb*, Redhat *rpm*).
- ▼ Use your existing software deployment.
- ▼ Standardized source layouts yields standardized extension ingredients.

# Standardized ingredients

# Automated software deployment for office extensions

- ▼ Parametrized office extensions. 
- ▼ Automated packaging and deployment of office extensions. 
- ▼ Activation of office extensions on a per-role basis.

# Automated software deployment for office extensions

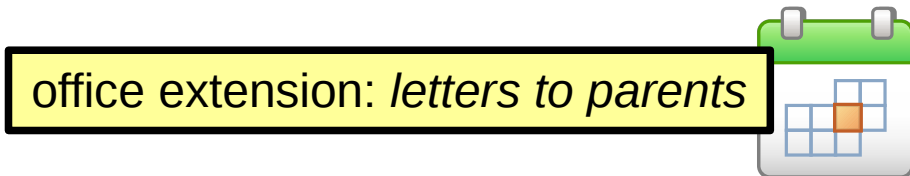

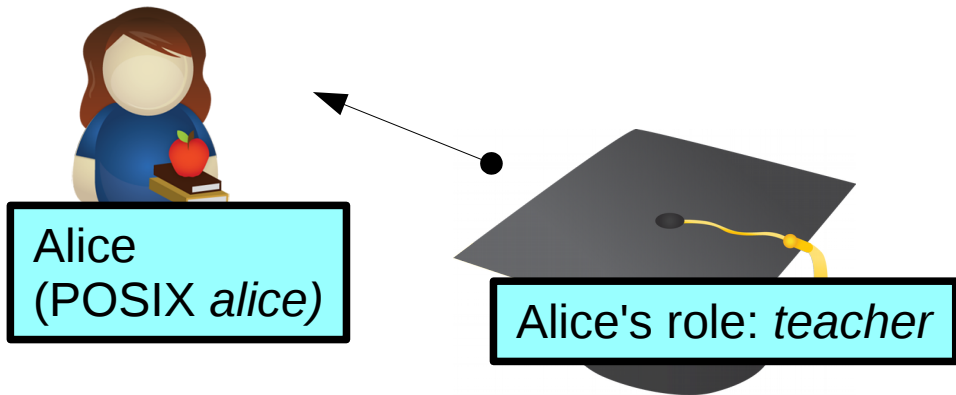

- ▼ Parametrized office extensions. 
- ▼ Automated packaging and deployment of office extensions. 
- ▼ Activation of office extensions on a per-role basis.

## Challenge:

- ▼ »Activation« for regular applications done via start menu.
- ▼ This does not make sense for office extensions.
- ▼ Different mechanism required.

# Activation of office extensions based on roles – example

Aim: After *alice* (or any other *teacher*) has logged in, *letters to parents* (with its menus, toolbars, templates) is visible. But not if another user (non-*teacher*) logs in.

How to achieve this?

# Activation of office extensions based on roles – basic options

option	scope	technique
executing <code>unopkg add</code>	user-local	educated tool usage (complex)
executing <code>unopkg add --shared</code>	system-global	educated tool usage (complex)
installation into <code>/usr/share/libreoffice/ share/extensions/</code>	system-global	file system (simple)

No option matches our needs in the first place!

# Activation of office extensions based on roles – unopkg add

- ▼ Why `unopkg add` is a bad idea.
  - ▼ Tinkering with user's office configuration is hard: strict separation of managed and non-managed material is required.
  - ▼ Space is wasted in the user's home directory.
  - ▼ User is able to tinker arbitrarily with material in his home directory.

# Activation of office extensions based on roles – key idea

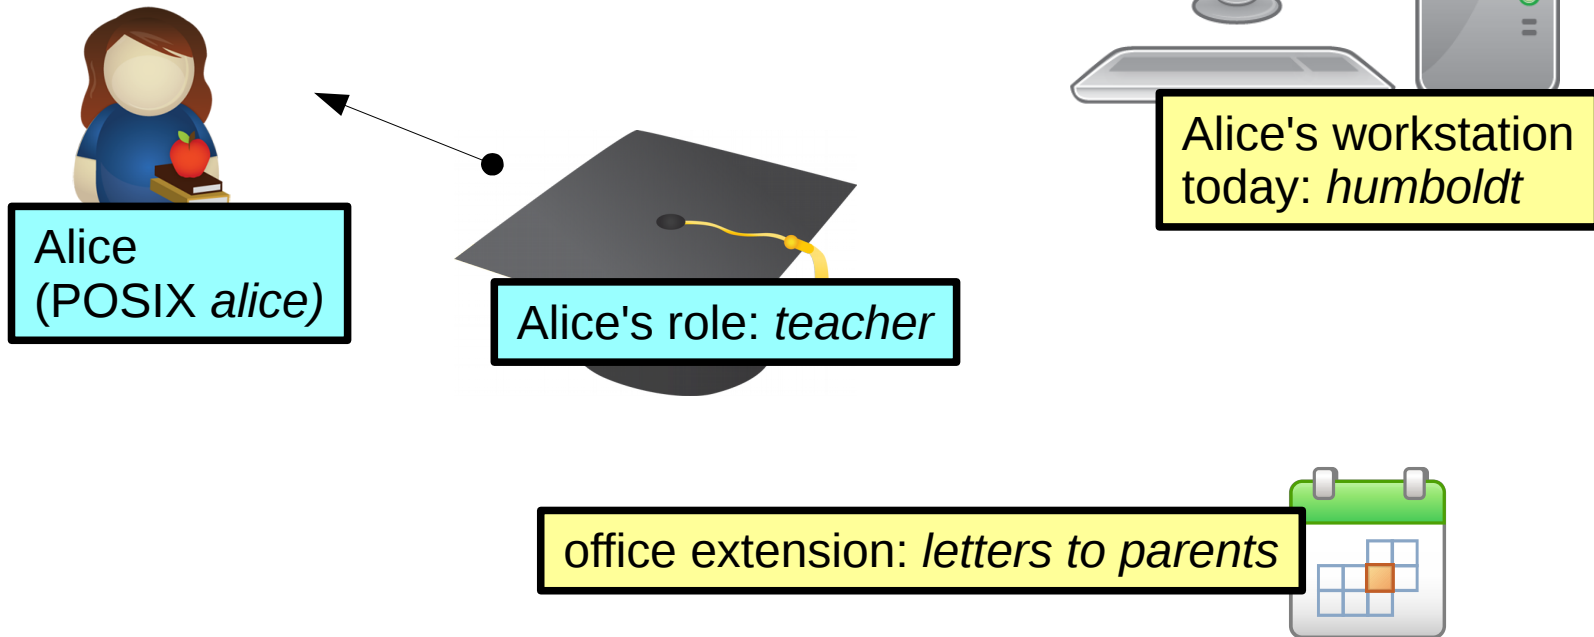

- ▼ **Combine** `/usr/share/libreoffice/share/extensions/...`
- ▼ ...with a traditional POSIX technique.

# Activation of office extensions based on roles – key idea

- ▼ Combine `/usr/share/libreoffice/share/extensions/...`
- ▼ ...with a traditional POSIX technique.
- ▼ Recall our running example:

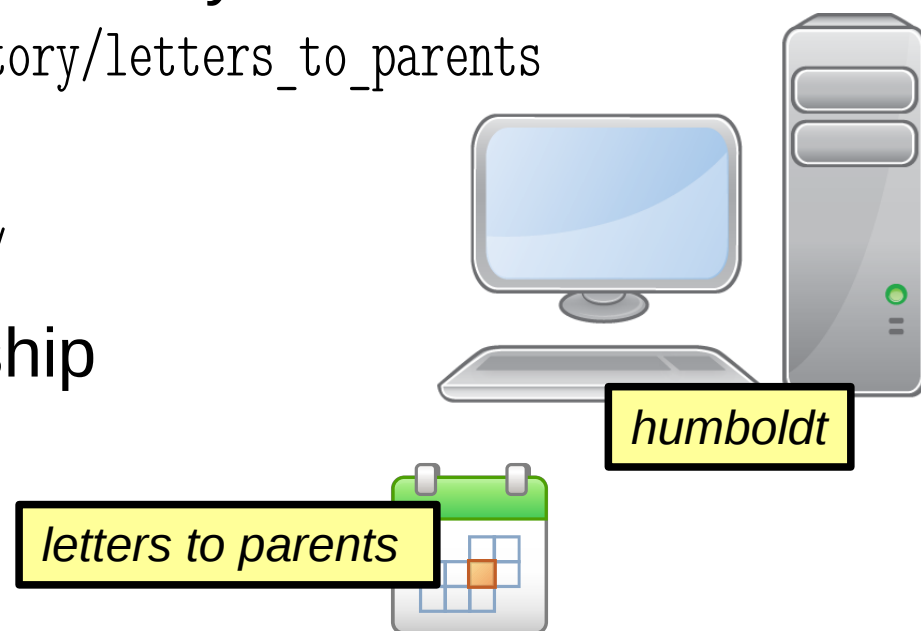

# Activation of office extensions based on roles – key idea

- ▼ Combine `/usr/share/libreoffice/share/extensions/...`
- ▼ ...with a traditional POSIX technique.
- ▼ Using symbolic links:
  - ▼ Install extension into *separate* directory  
`/usr/share/libreoffice/extension_repository/letters_to_parents`
  - ▼ Link by symbolic link(s) from  
`/usr/share/libreoffice/share/extensions/`
  - ▼ Use appropriate POSIX ownership and permissions.

# Activation of office extensions based on roles – detail

`/usr/share/libreoffice/share/extensions/`

Extensions placed in this directory are visible in office.

`/usr/share/libreoffice/extension_repository/letters_to_parents`

*letters to parents*

*teacher*

Location where extension package has been installed.

# Activation of office extensions based on roles – detail

```
/usr/share/libreoffice/share/extensions/teacher@letters_to_parents
```

Purpose of this indirection becomes clear when looking at its ownership

pointing to...

```
